Recovering data lost due to system malfunction or user error requires hours of work preceded by hours of research from unsuspecting victims. Educate yourself about possible ways to recover data from damaged disks and corrupted flash memory cards before the failure happens.

While there is no lack of data recovery tools on the market, downloading and trying one after another is the worst idea ever. A badly executed unsuccessful attempt to recover lost files can and does cause irreparable damage to corrupted data.

How would you choose the right data recovery tool to do the job? There are several criteria to data recovery software that you should be aware of. First, there are tools designed to recover your files and data, such as Office documents, archives, pictures and other stuff, and there are tools that repair the damaged disk structures such as the file system (FAT or NTFS), MBR and partition table. Note that the second class of recovery tools cares little about what happens to your data, often messing up with your files while repairing the damaged system structures.

Second, if you are new to data recovery, you need a tool that is as easy to use as possible. You don't want data recovery tools advertised as 'professional', as only the real professionals can benefit from using those. Let us be honest: you're more likely to screw things up with these tools as they deliberately lack any protection against possibly disruptive actions on your side.

Third, get only those tools that can demonstrate their ability to recover data instead of taking their word on it.

Smart Data Recovery (http://www.smartpctools.com/data_recovery) by Smart PC Solutions is a perfect solution for rush data recovery. If you have no specialized experience in data recovery, but need your data back right away with no risk, Smart Data Recovery is an ideal tool for you.

Fixing your files and recovering your data, Smart Data Recovery (http://www.smartpctools.com/data_recovery) is designed as a fully fool-proof solution. A simple step-by-step wizard guides you through the recovery process, asking you questions that are easy to understand and to answer, such as asking you to pick a disk that contains files to recover. To make things run even smoother, Smart Data Recovery has a U3/USB edition that runs from a flash memory card, minimizing unnecessary writes to the damaged disk.

Smart Data Recovery (http://www.smartpctools.com/data_recovery) can often recover files even if your disk has been reformatted (on FAT formatted disks). Smart Data Recovery can recover data from disks formatted with all versions of FAT or NTFS. The pre-recovery preview demonstrates you exactly what the recovered file will look like, making you sure that the recovery is actually possible. Don't take our word on it!
