

Today, you can find new and exciting ways to store and transfer your information. Before there were tiny memory sticks, most used external zip drives to store and move things around. The memory stick changed all of that, and made things so much easier to use. The design meant that they could be used with all types of devices, and you could put a huge amount of information on something that is not much larger than a postage stamp. One of the most popular sizes of these is the 2gb memory stick, but there are many different sizes from which to choose.

Though there are many sizes large and small, the 2gb memory stick is very common because of the amount it can hold and the price. They are not as expensive as they used to be, as happens with most items of this sort, and they come in at a price that many find affordable. They can hold a very large amount of digital photos, and that is probably one of the most common uses for these 2gb memory sticks. If you don't use one with your camera, you are going to find your internal memory won't hold an acceptable amount of pictures, especially if you love taking a lot of them.

You may also find a need for the 2gb memory stick, or ones of other various sizes, when you buy a new mobile phone. I just got a new Razor phone, and in order to store photos without filling up my phone memory, I bought a card that goes with my phone. It is smaller than the one that goes in my camera, but it came with adaptors so that I can fit it in anywhere so I can remove the information. While you can't get the same quality of photo with a phone, you can get larger sizes and save a ton of them at once when you use a memory card.

What is really great about the 2gb memory stick is that when you finally get it full, you can download the information from that card into your computer with ease. You can do this no matter what type of information you have stored on your card. Most newer computers come with inputs just for the memory sticks, and all you have to do is insert the card and download. You can also find these docks when you go to a photo kiosk to download and print digital photos, making it fast and efficient. You don't have to buy the 2gb memory card size, but having a little extra is always a great idea.
