Pet owners, who have recently brought their pets to Florida, should be aware of the potential medical issues involved with exposing their pets to strange surroundings, infectious diseases, and usual climate conditions, new external and internal parasites, infectious diseases, and emotional distress. Many of the parasites in diseases Florida has to offer are not all that different found in the rest of the country except the warm climates increase the amount of time your pet is exposed.

Pet owners have recently moved to Florida need to give their pets plenty of time to adjust to their new surroundings. To prevent losing their pets whenever they leave the house they should be on a leash or in a fenced yard.

Rabies is a terrible disease that is transferable from animals to humans. The most effective preventative medicine for rabies is a yearly vaccine. Every county in Florida has rules enforcing rabies vaccination for all pets. Owners should be aware that any pet that bites the human who has not had a rabies vaccine will be immediately euthanized. Pets should receive their first rabies vaccination when it is approximately 4 months old.

Dog owners should be aware of a disease called canine distemper. Canine distemper is virus that can be found all over the world that can be effectively controlled with a vaccination. Pet owners living in Florida should be aware that the canine distemper virus is present year-round in the state. The canine distemper virus travels through the air. Although treatment for canine distemper is available it is difficult, expensive, and has a low success rate. Dog should be first vaccinated for canine distemper as puppies and giving booster vaccinations for the rest of their adult life.

Parvovirus infection is an extremely contagious viral disease that affects the gastrointestinal tract of dogs of all ages. Dogs to contract parvovirus infection generally die within two to three days if the condition is left untreated. Preventing parvovirus infection is done with a simple vaccination administered by her local veterinarian. Florida has reported many cases of parvovirus infection in recent years.

Because of Florida's warm, moist, climate cats and dogs are able to pick up the case of internal worms and internal parasites year-round. Internal parasites found in dogs and cats include hookworms, whipworms, roundworms, and tapeworms. A simple worming regimen is used to flush the worms from a pet's body. Because workers are potentially toxic to pets if administered improperly you should

consult your veterinarian before putting your pet on a worming schedule. Heartworms are large roundworms that live in the right side of the dog's heart. Heartworms cause a significant amount of internal damage. Early diagnosis is the best way to ensure survival other pet that has contracted heartworm disease. Medication given on a daily and/or monthly schedule that a starter when the dog is just three months of age is the best way to ensure that your dog never suffers from heartworm disease. Because Florida has a mosquito population that is present year-round dog should be medicated against heartworm disease throughout the year. Florida dog owner should also bring their family dog to a veterinarian for a heartworm test every six months. Because of the hurricanes that can sweep up and down Florida's coastline pet owners in Florida should consider purchasing a pet health insurance plan that will protect their pets in event of a hurricane. This plan should cover any medical costs the Pat might acquire from stress or injury and owner should consider purchasing a plan that would cover the expense of boarding their pets in case of evacuation.
