Article Body:

You made some important decisions. You picked out the computer that will do everything you want it to do. The basic minimum is usually the computer, monitor, speakers that were included, and the all-in-one printer/scanner/fax. The keyboard and mouse are connected. The speakers are connected. After you explore the system and all it has to offer, you are likely to want a digital camera.

Depending on what online activities you enjoy there are other accessories. Headphones with built-in-microphone to call friends and chat hands-free. Perhaps a web cam if you have distant relatives you'll never see any other way. But the one thing that allows you to reach out to all of them at once is a digital camera. With it you can put pictures of your life online, make a list of all the people you want to send them to and with one click you send an email with pictures attached to the entire group. Then by saving the email list you simply send new pictures to the same group again and again. You can stay in touch without spending a great deal of time.

The online Photo Album can serve the same purpose. Creating one is easy. You can then send the URL to all your friends and relatives. If this is something you will enjoy - the next step is to buy a digital camera. There are enough choices

to make your head spin. It can be tempting to choose one with all the settings that you won't know how to use. It'll seem practical to buy the cheapest model as a learning tool. Either of these choices may be wrong for you.

Before you rush off to the camera store or ebay there are many points to consider.

What level of experience do you have.

What pictures do you plan to take.

How often will you use the camera.

Will you use all the complex settings.

What brand will function with your computer.

How much money do you want to spend.

If you have never taken many pictures and plan to take them on holidays or vacations only you'll choose differently than the computer geek who can't wait to get his hands on all the bells and whistles of that new D-SLR. It has all the features and accessories used by professional photographers. Needless to say, the high price tag also.

At the other end of the spectrum is the economy model that you might consider a good starter camera. You might imagine yourself learning to use it then upgrading when you have more experience. If you go this route it is like tossing \$50 or so out the car window. You put batteries in and thats all it tells you how to do. There may be no instructions, no manual to describe the features and no helpline or chatline to use when you are stumped. Among the other bad features, the viewing screen will be too small.

Your journey from noobie to expert photographer is likely to be more successful using a model that falls somewhere between the two extremes. If you have an upcoming event and need a camera for it, why not buy one of the disposable ones. Then give yourself adequate time to research cameras. That way you make an informed choice based on the criteria listed above.
