**Article Body:**

Technology has brought about many ingenious devices. It drives on. The Personal Computer began limited programming tools that could do much, but required programming that wasn't available. That changed dramatically over a quarter of a century.

Along the way many wireless technologies such as Blue tooth came that make it even handier than ever; eliminating mounds of wires that made up computer systems all over. The GPS unit has done the same in respect to stacks of maps to spill coffee on and lose to water damage over time.

GPS and Blue tooth technologies have met, and life will never be the same! Blue tooth GPS features make the best of both worlds. On one side you have an interactive device that is highly specialized in being on the move. Maps, position, and even finding resources wherever you are among the benefits. It has storage limits and of course is specialized and compact.

While the PC has connected to many GPS units at some level, today without wires the interoperability has exploded in capability thanks to Blue tooth wireless technology.

What Makes The Blue tooth GPS Tick Usefully?

Blue tooth technology is a revolutionary medium for small-area networking. With a Blue tooth GPS data is passed to your computer via this wireless network without requiring your involvement. No longer do you have to fight with connectors that ultimately wear out where they screw in to put your latest travels in for use with your favorite programs. Just come in range of your Blue tooth network signal with your GPS and a number of advanced features occur automatically. It's just as easy to send data into your GPS as well.

It's wise to understand how the Blue tooth technology works, so you can understand configuration parameters that keep your information yours; though like any technology today there have been privacy considerations. Understanding is wise to be sure you authorize what goes where.

### Getting Your Own Blue tooth GPS

New models of Blue tooth GPS are added monthly as old ones are pulled from the market. Popularity has made it move that fast. They range in features with price tags that move accordingly. When shopping for a Blue tooth GPS you should spend adequate time to become familiar with all the features and models; then decide what is best for your situation.

A great place to start is the manufacturer's websites. There you will see all of their latest offerings and usually with full details. You can also find many user experiences and reviews of the same on many sites. A great place to look for all of this is where you are now browsing. Have a look at all there is to offer and the links elsewhere that may even take you further.

In the end, probably your largest concern is whether a Blue tooth GPS will give you an advantage or sit in your closet. That probably should be the number one buying concern as they aren't the cheapest GPS you will find; though they offer time savings that you can spend more on your treks if you have a Blue tooth GPS.
