registry cleaner, window registry cleaner, registry, registry cleaning software

**Article Body:**

Before you select a registry cleaner for your windows based PC, find out how beneficial it is for your system's performance.

These days, more and more computer users are using registry cleaner software to keep the registry clean and to keep their computers in good health. Computers are the information highway of the 21st century, and most households in the United States use computers for various reasons. The more you use your computer, more information gets stored in its registry. The benefit of a registry cleaner is that it helps 'slim' down the registry by removing the unnecessary data thereby making your computer run faster. The registry of your computer is the section where all applications create entries for temporary data, and these entries are never deleted by on their own. The more data your computer processes, the more bloated your registry gets, often slowing down your computer.

It is necessary that you use a window registry cleaner, periodically, to remove all the unnecessary data in the registry. Over time the invalid entries, resulting from uninstalling or incorrectly removing of the software accumulate in the registry. A registry cleaner simply deletes these entries from the registry and helps your system to function at its optimum level.

The Benefits of Cleaning The Registry

This is normally what most computer users do:

- Frequently install or uninstall programs
- Delete software that was never really fully "uninstalled"

Alternately, your computer may have an embedded Spyware, or you may have unused but undeleted drivers in your system. All such accumulated problems can lead to stalls in the system, or reduced operating speeds. This is where a registry cleaner comes in handy. Before the problems rise to such levels, cleaning your registry periodically gets rid of all these extra entries; trimming your registry down and making your computer run at a faster speed.

With improvements in technology, newer window registry cleaners are coming in the market with new improved features:

- A registry cleaner with a scan and repair feature scans the entire registry records, and does not eliminate valid records. It leaves your computer with a 'trimmed' registry and a better computer performance.
- There is a feature that is similar to de-fragmentation of the files. It removes the empty spaces and fragments, making the computer run faster.
- Certain registry cleaners come with special features that detect and clean the embedded keys that are generally undetectable. These embedded keys have malicious codes that are used by malware (malicious software).
- Most registry cleaning software have a 'schedule and forget' feature, which allows you to set a schedule for a registry scan, fix, backup, and eliminate the routine unnecessary entries in the registry.

When you first install a new system, you will most probably, never notice a registry problem. As your usage increases, the frivolous entries in your registry become larger and larger, especially with the installation and removal of software, drivers, and other components. This slows down your complete system.

This is where you benefit the most from using a registry cleaner that deletes these unnecessary entries and increases the operating speed of your system.
