Digital cameras are different from regular cameras because they have a computer built into them. This means that you can later transfer the images to your pc and play around with size and definition. Digital cameras have been around for a while now and the prices are just about on a par with the prices of a good regular camera.

If you are looking for a digital camera, there is plenty to choose from - with prices that should suit most budgets. Some digital cameras are better than others but it is a good idea to do your homework before handing over the money. If you don't, you could end up with a camera that does not suit your needs.

What advertisers call the perfect camera may not be perfect for you. In addition to this, advertisers are trying to sell a product and what they call perfect today may not be tomorrow. You, on the other hand, want a camera that does what you need it to do and that will last for some time. Advertisers are not really concerned with people's particular needs, just with popularizing a product.

Before you set out to buy a camera, it's a good idea to have some understanding of the terms you might come across. For example, you may hear the retailer mention pixels and not know what they are. Pixels are the dots that make up the picture. Thousands of these dots are known as megapixels, the more megapixels

you get, the sharper the picture you end up with.

Megapixels can also determine the price of a camera, the more you have, the more expensive the camera will be. A lot depends on what you want the camera for. If all you want to do is take family photos and email them to friends and relatives, a normal four megapixel camera should be just fine. If you want to use it professionally, you may need something with more pixels.

You might also want to consider size when buying a digital camera. Now days, you don't have to buy large cameras - some are so small they will fit into a shirt pocket. However, size is also affected by price. It takes greater technological know-how to make a small camera than it does to make a regular sized one. Most people who take family photos do quite well with a regular one.

The information above should give you some idea of the general things to look for in a digital camera. Now it is up to you to decide which camera you think is the best for your particular needs.

Once you have thought about those aspects, you should have an idea of the kind of camera you want and it should enable you to look at the lists of digital cameras online or in the stores and short-list any suitable models.

You should then try to look and, if possible, handle the actual cameras, either in store or, better yet, if people you know already own them, you are likely to get better answers to any questions you may have.

Then try to find examples of any pictures taken to see the quality and whether it meets your expectations.
