

Gardening Advice

Garden advice is not that hard to come by. In fact, you can get gardening advice from another gardener, in a gardening catalogue, gardening books, gardening magazines, and even on the Internet. Although you will have variations with every plant, there is some gardening advice that is universal and that goes for any plant.

For example, the gardening advice given for planting is pretty much uniform. You must place plants where they will have room to grow so they don't overcrowd each other. Good air flow is a plus, and plants must be in a position where they will receive adequate amounts of sunlight. Advice will always tell you to add some type of nutrients to the soil to lead to better plant growth, such as mulch or compost.

Gardening advice on watering plants is a little more varied, because every type of plant needs different amounts of water. For example, you wouldn't want to water a cactus near as much as you water a tomato plant. How much you water will obviously also depend on where you live, the climate, and how much rain your area receives.

Gardening advice from nearly every source will tell you that your plants not only need fertilize when you first plant them, they will also needed to be fertilized throughout their growing season. What type of fertilize used will depend on the soil content and pH balance, but fertilize will definitely be needed on most all plants. Compost can be used instead and it is easy to find advice on how to make a compost pile as well as when fertilize and compost needs to be used.

Gardening advice on weeds, insects, disease, and how to get rid of them is probably the most sought after advice in all of gardening. These pests invade all gardens and if you don't get rid of them, they will take over and ruin your garden. There are many different chemicals and pesticides that can be used, and gardening advice will usually clue gardeners in on which chemicals are better, which are harmful, and which ones are easier to administer.

Gardening is not an easy task; you have to fight against many outside forces, such as weather, insects, disease, and weeds. Even the most seasoned of gardeners will seek out gardening advice once in a while. Who wouldn't when there are so many forces that could take a garden out? There is a lot of general gardening advice on the market that goes for any plant, but if you look a little harder you will find specific advice for that one plant that is the only one giving you trouble. Gardening advice is relatively easy to find, and

while you may come across the occasional bad apple, most of it is relatively sound and will help with any gardening question.
