Article Body:

Apple has launched a small web application that will let customers check up on iPhone availability at its 164 national retail stores. The Apple retail availability tracker allows iPhone seekers to select their state of residence and then will display a list of Apple retail stores with iPhone availability indicators. If there is a green dot next to your local Apple store, then iPhones are in stock. A red dot indicates that iPhone availability is negative. This simple system is a great way to see iPhone availability without trouble. It is an incredibly user-friendly system that can be used by almost anyone.

Unfortunately, however, Apple plans only to update the tracker system on a nightly basis. This, therefore, means that shoppers might want to supplement the information available on the site by placing a call to the local Apple store just before making the trip. This will ensure iPhone availability and save time and hassle.

A separate section of the Apple retail availability tracker website also informs the iPhone shoppers on how to "get the most out of the iPhone," offering lists of free workshops that cover the basics of the iPhone and beyond. In addition, the Cupertino-based company notes that its One to One members will have easy access to private tutorials on everything from how to sync their iPhone with iTunes, to receiving and sending email and surfing the web. Reservations for these One to One tutorials can be made up to 14 days in advance.

The iPhone retail availability tracker is a great tool made by apple. Informing all potential shoppers on where your product is available is a great idea. Shoppers will be more much more willing to buy products if they know that when they go to buy the product, it will be available.

IPhone availability, though, has not been a huge concern. iPhones have been widely available for all buyers. It has not been too difficult for a desiring customer to find a store with iPhone availability. The quantity of phones available has stayed relatively the same since the release of the iPhone. Also, buyers have not been incredibly fast in purchasing iPhones. It seems that many are willing to wait for the price to drop and for the bugs to be worked out. Therefore, Apple doesn't plan on raising the output of iPhones in the very near future. iPhone availability is good, and buyers are happy. Shortages have not been a concern at all.
