Article Body:

Taco is highly used in the business of developing and manufacturing hydraulic based components for use in residential, commercial, industrial and institutional heating and cooling systems.

A pump is a device used to move liquids, or slurries. A pump moves liquids or gases from lower pressure to higher pressure, and overcomes this difference in pressure by adding energy to the system (such as a water system). A gas pump is generally called a compressor, except in very low pressure-rise applications, such as in heating, ventilating, and air-conditioning, the equipment is known as fans or blowers.

Pumps or circulator pumps are an integral part of any hydronic system when installing or adding radiant heat to homes and businesses. These pumps are used to send water to an area of the hydronic system when it is called for, or to keep the flow of water in the system. PexSupply.com features a large selection of Cast Iron and Bronze taco pumps, including the best-selling 007 Taco Pump, reliable Bell and Gosset pumps and Taco IFC Pumps with Integral Flow Chek.

**Bosch Tankless Water Heaters **

Bosch Pro Tankless Water Heaters also known as Aquastar Tankless Water Heaters come in Natural Gas (NG) and Propane (LG). We also carry Ariston and Powerstar electric tankless water heaters.

We offer competitive prices on Taco Flo-Control Valves, which can be used in forced hot water heating systems to prevent "gravity~ circulation during periods

when the boiler is hot, but the space heating zone is not wanted. Taco Flo-Cheks come in several sizes and connection types.

Taco Flo-Control Valves

Taco Flo-Control Valves have a combination of straight/angle configurations in sizes 3/4 to 2 for easy installation. They have removable top caps as well that allows easy cleaning and service without removing pipe connections.
