

**Title:**

Is Excel Running Your Business? A Transition to Project Management Software is Worth the Investment.

**Word Count:**

413

**Summary:**

Businesses small and large have been using MS Excel for years to run processes and manage projects. For small, simple projects Excel is a useful organizational tool. However, projects have a tendency to grow in complexity at a rate that Excel can not keep up with. Project management software

**Keywords:**

Project management software, ppm, pm, epm, project management system, enterprise project management, excel, interneer, intellect, project execution, project and process management, management software

**Article Body:**

Businesses small and large have been using MS Excel for years to run processes and manage projects. For small, simple projects Excel is a useful organizational tool. However, projects have a tendency to grow in complexity at a rate that Excel can not keep up with.

Imagine that a business needs to track projects or processes and does not have the time or budget to put a sophisticated tracking system in place. An IT department does not exist or is busy handling other affairs. Excel often seems to be the obvious, quickest and easiest resource to get things started.

Skip ahead a few months or a year later and those same Excel spreadsheets have now become a burden to the company. Many different versions are being passed around. No one knows who has the most up-to-date files saved on their computer. The project has evolved, making the spreadsheets so complex that only one person understands how to update them or even interpret them, in some cases.

It is now nearly impossible to generate reports from the spreadsheets or track progress and historical data. The data is also not searchable since Excel does not function as a database. The list goes on and on with all the limitations.

It is very understandable why business professionals turn to Excel to run critical processes: most already own a license on their desktop and are familiar

with enough to quickly get the project started. They can even bypass IT altogether and maintain the Excel files themselves. The problem is Excel was never intended to be used as project management tool. It is no surprise that collaborating via spreadsheets becomes unbearable rather quickly as projects and processes grow in complexity.

Project Management software solutions such as <i>Interneer Intellect</i> provide business professionals with the same benefits they seek with Excel - ease of use, quick setup, ease of maintenance without IT - all with the full benefits and robustness of a database system, that is collaborative, web-based, multi-user and enterprise level. These systems even incorporated many other features that make it easier for the business users to manage documents, projects and process workflows.

Excel is best for what it was designed to do - accounting and financial calculations. Stop running your businesses on a thread and read white papers and view demos of project management software system. Web-based systems like Interneer Intellect allow for real-time collaboration between team members anywhere. The time saved using project management software will provide ROI.
