Article Body:

Mesothelioma and asbestos are so much linked that many people call it by the name of mesothelioma asbestos. While mesothelioma is a serious cancer, asbestos is its main cause. While one may approve of things that remain of use for a long time, their effect on the surroundings decides the worthiness of that product in the end. The same holds true with asbestos. The 1940s and 1950s saw a surge of 'asbestos' as the next best thing to happen after cement in the construction industry. Due to it's high degree of stability and resistance to very high temperatures, asbestos was applied greatly in insulators and ceiling tiles in homes, schools and factories.

However, this product is a harmful contaminant. Asbestos has the tendency to break into small particles and remain suspended in the air for longer durations. Any individual that comes in contact or inhales it becomes vulnerable to serious diseases such as asbestosis, lung cancer or the mesothelioma lung cancers.

Types of Mesothelioma:

Mesothelioma, asbestos related cancer, acquires it's name from the mesothelium cells that are responsible for protecting and enabling easy movement of our vital organs such as lungs, heart and the abdomen in the body. Mesothelioma is generally of three types, pleural mesothelioma, peritoneal mesothelioma and pericardial mesothelioma.

If a person is suffering from hoarseness, difficulty in breathing, loss in weight, coughing, blood in sputum, chest pain, weak muscles, reduced tactile sensitivity, he may be suffering from Pleural mesothelioma or the cancer of lining of the lungs. This is the most common type of mesothelioma and almost two-thirds of the mesothelioma patients suffer from pleural mesothelioma. The Peritoneal mesothelioma or cancer of the lining of the abdomen causes impaired bowel motion, bloating, swelling in feet, and nausea. This is less common among mesothelioma patients and it affects one-third of the mesothelioma patients. Pericardial mesothelioma is of the cancer of lining of the heart. It is also caused because of asbestos exposure. However, its prevalence is rare. Pericardial mesothelioma manifests in the form of chest pain, palpitations, cough and dyspnea.

Lawsuits Related to Mesothelioma and Asbestos:

The hazardous consequences of long term contact with asbestos and its linkage to mesothelioma cancers has led to several lawsuits against its manufacturers. The mesothelioma or asbestos attorneys claim that the asbestos manufacturers were aware of the harmful affects of asbestos exposure and yet persisted with its use for profit motives. This is the reason why juries have ordered stringent awards in many mesothelioma and asbestos related lawsuits.
