Disable Your Computer's Parasites

An individual who uses a computer with an Internet connection pretty much
practices caution when downloading programs from the Internet and email because
of the threat of viruses and worms. These malicious program codes and programs
can cause your system to become unstable and worse yet, after it has spread
within your system, it further infects other systems connected to yours.

This is why any sensible computer user has anti virus programs installed in
one's computer for protection against attacks from viruses and worms that
proliferate the Internet. The good thing about viruses and worms is the fact
that it is easier to spot them trying to get into your system. For instance, a
virus or worm can try to enter your system through a suspicious attachment
usually from an unknown source. By now, most Internet users know better than to
open suspicious attachments. Also, rigorous anti virus programs can scan
attachments before you can open them so that your risk against viruses and worms
are properly managed.

However, as an Internet user, you have more to worry about than viruses and
worms. Unfortunately, anti virus programs are not designed to detect other types
of threats and if you are not careful, you may unwittingly install adware and
spyware into your system and once this happens, uninstalling these programs can
become problematic. For one thing, most spyware can go undetected in your
system. You will continue on your regular computer and Internet habits without
realizing that your privacy is immensely violated and your security is greatly
hindered.

Since spyware can go undetected and you can continue to use your computer and
the Internet as usual, there is no need to worry about uninstalling spyware,
right?
Wrong.

Spyware in mild cases infringes on your privacy because it can track and take
note of your usage patterns and these information are reported back to the
company that created the spyware so that they can build marketing profiles. More
than that though, some spyware have the ability to register and take note of key
strokes, scan documents within your computer's hard drive, and can steal your
passwords and other sensitive information that can make you the victim of
identity theft and other situations where your personal information can be used
to compromise your security.

On the other hand, adware is used by companies to infect your computer with
unsolicited ads. The most problematic kinds are the ones that indiscriminately

pop ads on to your screen even if you are not viewing their site or using the parent program that launched the adware. In fact, in some cases, adware continues to work into your system long after you uninstalled the program it came bundled with.

Given the security risks, the invasion of your right to privacy, and the annoying effects of spyware and adware, you will be wise to uninstall these programs from your computer. However, to uninstall adware and spyware from your system is not such a simply task.

For one thing, companies that proliferate the Internet with spyware and adware go to great lengths to ensure that uninstalling them from your system can be difficult. For instance, in most cases, you will be unable to use legitimate software if you attempt to uninstall the adware or spyware it comes bundled with. Adware and spyware are usually bundled with legitimate freeware or shareware and cannot run independently of each other.
