A notebook computer is a term used interchangeably with laptop computers. For those of you not familiar, a notebook computer is one that is smaller and lighter than a personal computer. You can take it with you anywhere so it offers you more access to the internet, a way to watch movies, and even a way to work while you are away on business trips.

The first notebook computer was introduced in 1981 but they were very expensive and not as versatile as they are today. IBM and Epsom both placed versions of portable laptops on the market in 1983. Even with more models emerging, notebook computers were an item often associated only with high profile businessmen.

It wasn't until 1995 when Microsoft introduced their operating system Windows 95 that the world of notebook computers exploded. This operating system along with advances in technology that allowed notebook computers to function in the same ways as a personal computer led to them dropping in price and more consumers buying them.

Some of the improvements that occurred around this time were a better battery that no longer included acid. Power saving notebook computers were introduced so the life of the battery lasted much longer. They also were now able to hold more data so they could be used for more concepts at any given time.

Today you see people of all ages carrying their notebook computers to the office, home, on airplanes, colleges, and hotels. Many public places are set up with areas for individuals to conveniently use their laptops. Since we live in such a computer age having a notebook computer can help you stay on top of things for work and pleasure no matter where you go.

You can find notebook computers in a variety of sizes and from multiple manufacturers. They come with a good price, plenty of storage capacity, and warranties. If you are in the market for a notebook computer you will have no trouble finding exactly what you are looking for.
