The first thing you need to do after a system crash has forced you to reformat
your hard drive is to test your PC to make sure whatever caused the crash is
still not around to destabilize your system. Once you know your PC is stable,
you can begin the process of data recovery after formatting.

Do-It-Yourself Data Recovery After Formatting

The easiest way to get proof of your system's stability is to upload some non-
critical files, so that if they become corrupted you will not have lost
anything. Try opening and closing the files, and as long as you do not get a
message saying they have been corrupted, you can be fairly certain that your
system is functioning normally and storing ant retrieving your data properly.
You can move now move on to the data recovery after formatting process.

During the data recovery after formatting process you'll upload all your
recovered data, and for some systems this can take a considerable amount of
time. You'll need to monitor the data recovery after formatting process in case
your system flashes messages with question or pinpointing errors on specific
files. You'll need to make a record of every file mentioned in a message, and
when the data recovery after formatting upload is complete, do individual checks

on each of them. Often an error in one file can compromise the performance of an entire program.

When your data has been completely uploaded, you can go through the key files in each of your programs one at a time, and open them to see if all their data is intact. In some cases, you may have to delete and reinstall some of your software. For more indo see http://www.pcdatarecoveryhelp.com/Data_Recovery_After_Formatting/ on Data Recovery After Formatting.

Software For Data Recovery After Formatting

Another approach to data recovery after formatting is to purchase Windows data recovery software. The data recovery after formatting software can give you step-by step guidance in retrieving data lost sue to formatting, deletion, or partition damage as long as your hard drive has not been physically damaged.

Formatting your hard drive will change your data partitions, and data recovery after formatting software can retrieve data from the previous partitions or even from corrupted sectors. It is designed to support data recovery after formatting for both older file allocation table (FAT) and new technology file systems (NTFS). That covers all Windows operating systems as far back as Windows 98.

Data recovery after formatting can be both challenging and time-consuming. But being able to restore all you key files, either through your own efforts of with the help of user-friendly software, can save you a tremendous amount when compared to the fees of a data recovery specialist.
