Title:
Advancements In Computer Technology

Word Count:
322

Summary:
With technology progressing as fast as it is at the present, it is a wonder we
do not have a new mass-marketed gadget appearing every few minutes. Personal
computers, once predicted to be owned by a mere handful of individuals, are
everywhere nowadays. If you are a student a personal computer is virtually a
necessity. Accompanying the ever-increasing popularity of the personal computer
is a plethora of gadgets and technological advancements. Though it may not be
every few min...

With technology progressing as fast as it is at the present, it is a wonder we
do not have a new mass-marketed gadget appearing every few minutes. Personal
computers, once predicted to be owned by a mere handful of individuals, are
everywhere nowadays. If you are a student a personal computer is virtually a
necessity. Accompanying the ever-increasing popularity of the personal computer
is a plethora of gadgets and technological advancements. Though it may not be
every few minutes, it seems as though every couple of months we hear about a
computer with more storage space or a new device that one can connect to their
computer.

Some devices that appear on the market are either completely superfluous or not
so accessible to the entirety of the population, whether it is because of their
cost or their limited supply. The costly devices are reserved to those who can
afford them, until some new gadget replaces them and the price of these machines
decreases, much like any new technology that appears on the market. Those
gadgets, which are unnecessary, are not overly practical and the market for
these creations is comprised mainly of those with an affinity for such devices.
Inventions like webcams, while they are certainly fun to play with, are
essentially unnecessary as they have no bearing on the actual operation of the
computer and are used largely for leisure computer activities.

The more purposeful advancements in computer technology revolve around those,

which increase the computers ability to manage certain tasks and those, which increase the storage space of the computer. Many personal computer owners find themselves craving more space to store songs or various other files and often wishing that their computer were faster. Though many computers produced today have a excessive storage space, that is, it is nearly impossible to fill a personal computer to capacity, these types of advancements permit a much speedier and more efficient functioning computer.
