Article Body:
There was a time when small businesses, specially mom and pop stores could get
away without keeping accounts of any sort. In fact, the only reason why they
were classified as mom and pop stores were because the business was run in an
unplanned manner. But with increasing number of people choose for small
businesses and the entrepreneurial plan being foster by governments worldwide,
these businesses have to come to represent a large part of the gross domestic
produce of countries worldwide. This is where the need for complete accounting
programs surfaced and that is why it has become a big issue for all businesses.

There are various accounting programs prepared to provide to the needs of all
type of businesses. While the smaller stores use separate accounting programs
and smaller, single user license versions of the more popular accounting
programs the larger stores need to use a complete set of accounting programs. Be
that as it may, the fact remains that all businesses, large or small, need to
use accounting programs of some kind in order to make more efficient their
process and to comply with governmental regulations.

One of the simplest accounting programs available in the market today is
Microsoft Money. While most computers bought in the United States of America
come pre loaded with this accounting program, it is applicable only for personal
finance calculations or maybe small business needs. But as accounting programs
go, it is fairly well designed to cater to the needs of smaller businesses. This

explains its popularity in terms of number of users who use it as their primary accounting program.

A slightly more evolved accounting program is something that has come to be recognized and sold as Tally. Like the name tells, this is an accounting program that provide to the needs of smaller businesses, where the accounting operation is primarily a function that tallies stock (either available or sold) with the cash available in the machines at the counter. That's not all.

An accounting program like Tally comes with a customizable order making it scalable for a variety of business operations. Therefore smaller businesses even in the services sector are able to use it to make more efficient their processes.

Today, the wide arrays of accounting programs available in the market make it easier for businesses not only to organize themselves, but also to obey with local, national and international requirements. Every business thus can adopt and organize the best practices that make globalization helpful to every one.
